

LiDAR and its applications

Dainis Jakovels

Institute for Environmental Solutions, Latvia

Light Detection And Ranging

Light (Laser) pulse
as an information carrier

Most common
wavelengths:

- 1064 nm for terrestrial
- 532 nm for bathymetric
- 1550 nm for terrestrial

LRR 10...300 kHz

**Detection of
the reflected signal
from target**

LiDAR systems:

- Single return
- Multiple returns
- Full wave form

**Range to target
calculation**

$$\text{Range} = c \cdot t / 2$$

Airborne Surveillance and Environmental Monitoring System ARSENAL

High resolution
60M px RGB camera
(AC-60)

1064 nm LIDAR
(ALTM Gemini)

Broadband TIR sensor
(TABI)
3800-4800 nm

Broadband
UVC sensor
(UVC-1800)
280-375 nm

VIS-NIR sensor
(CASI)
380-1050 nm
up to 288 bands
FWHM < 3.5 nm

SWIR sensor
(SASI)
950-2450 nm
100 bands
15 nm intervals

MWIR sensor
(MASI)
3000-5000 nm
64 bands
32 nm intervals

BN-2T-4S Defender:

- Payload – 400 kg
- Endurance – 8 hrs
- Low speed – 80 kts
- Take off from 400-500 m runway

Aerial photography of the center of Cēsis

LiDAR point cloud

Lidar data set consists of 1M returns covering 520x480 m area.
Elevation of points (returns) varies from 78...160 m.

Digital Surface Model (DSM)

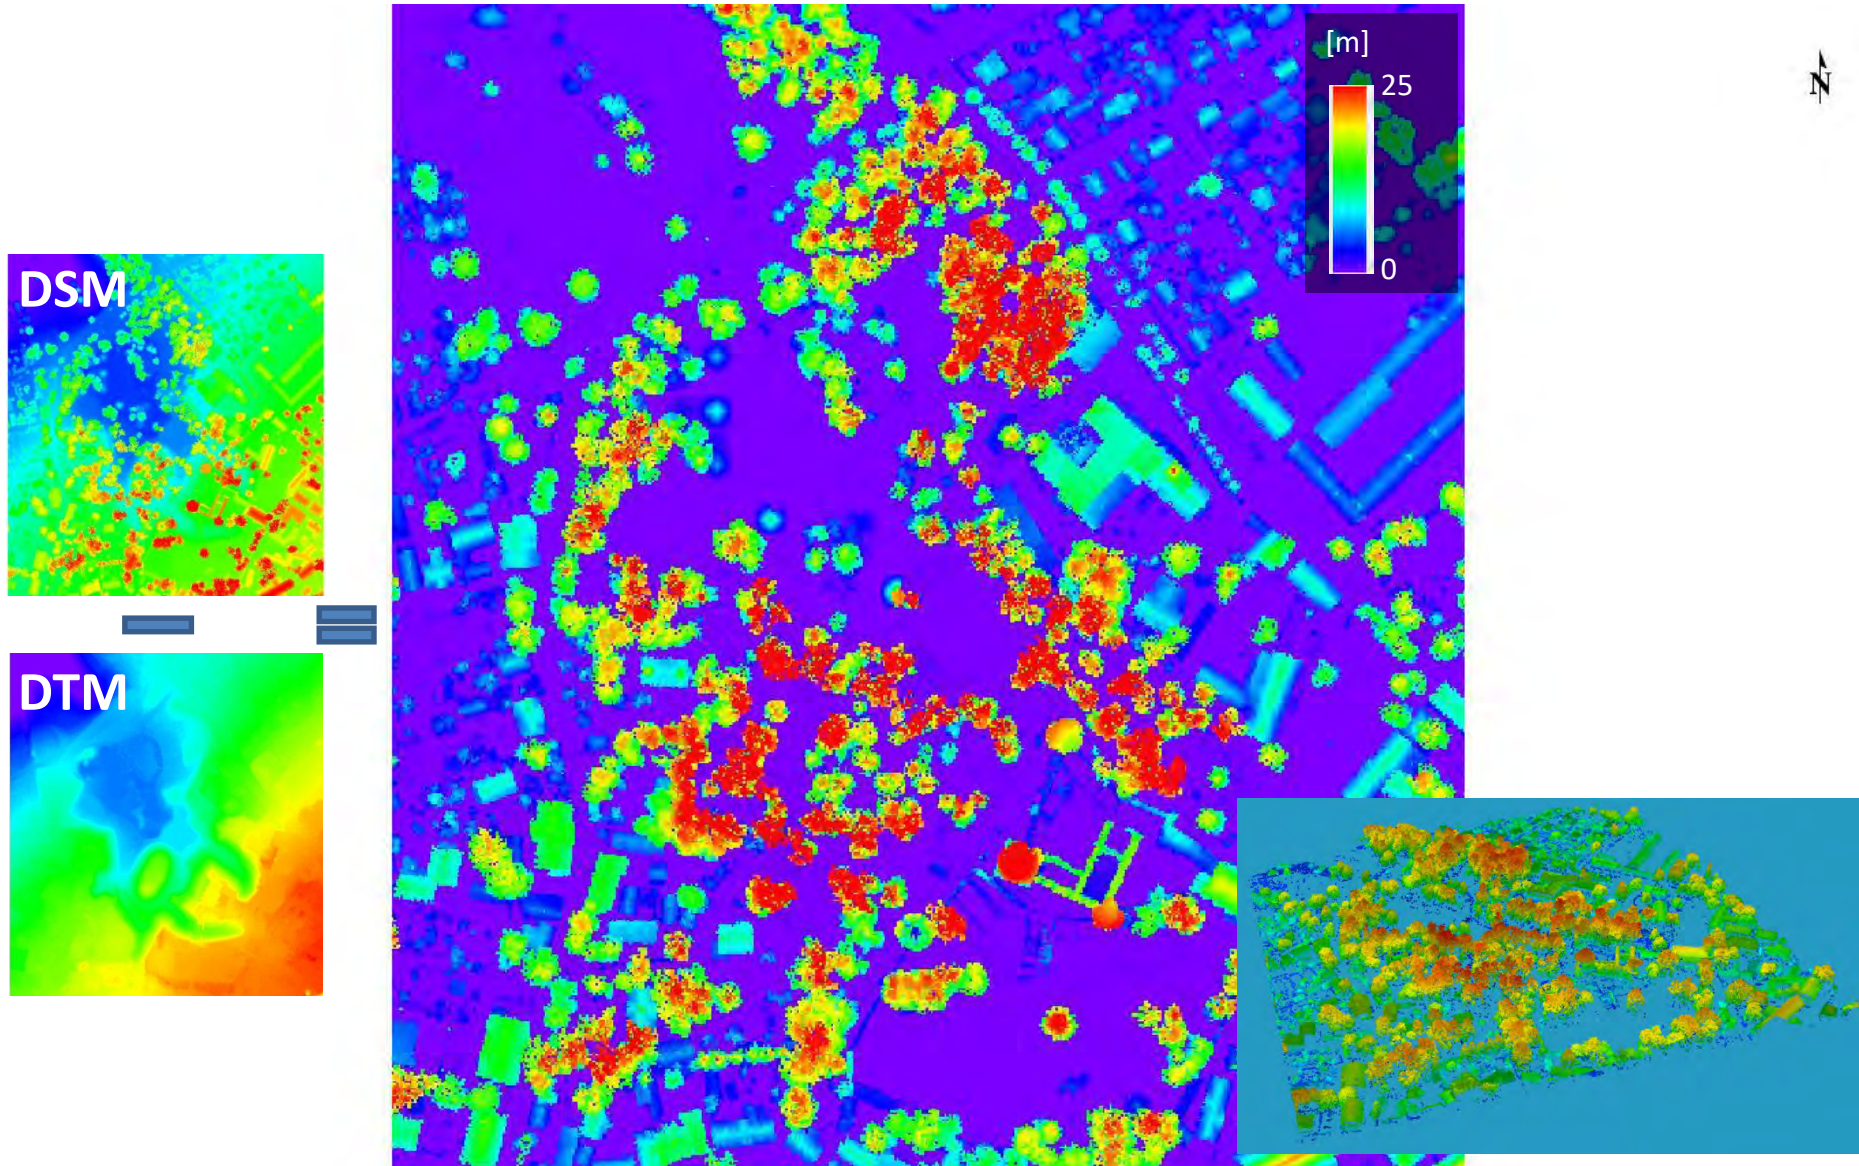

Points are converted into raster with 1m/px spatial resolution.
4% of DSM pixels (mostly water pixels in the pond) were filled by interpolation.

Digital Terrain Model (DTM)

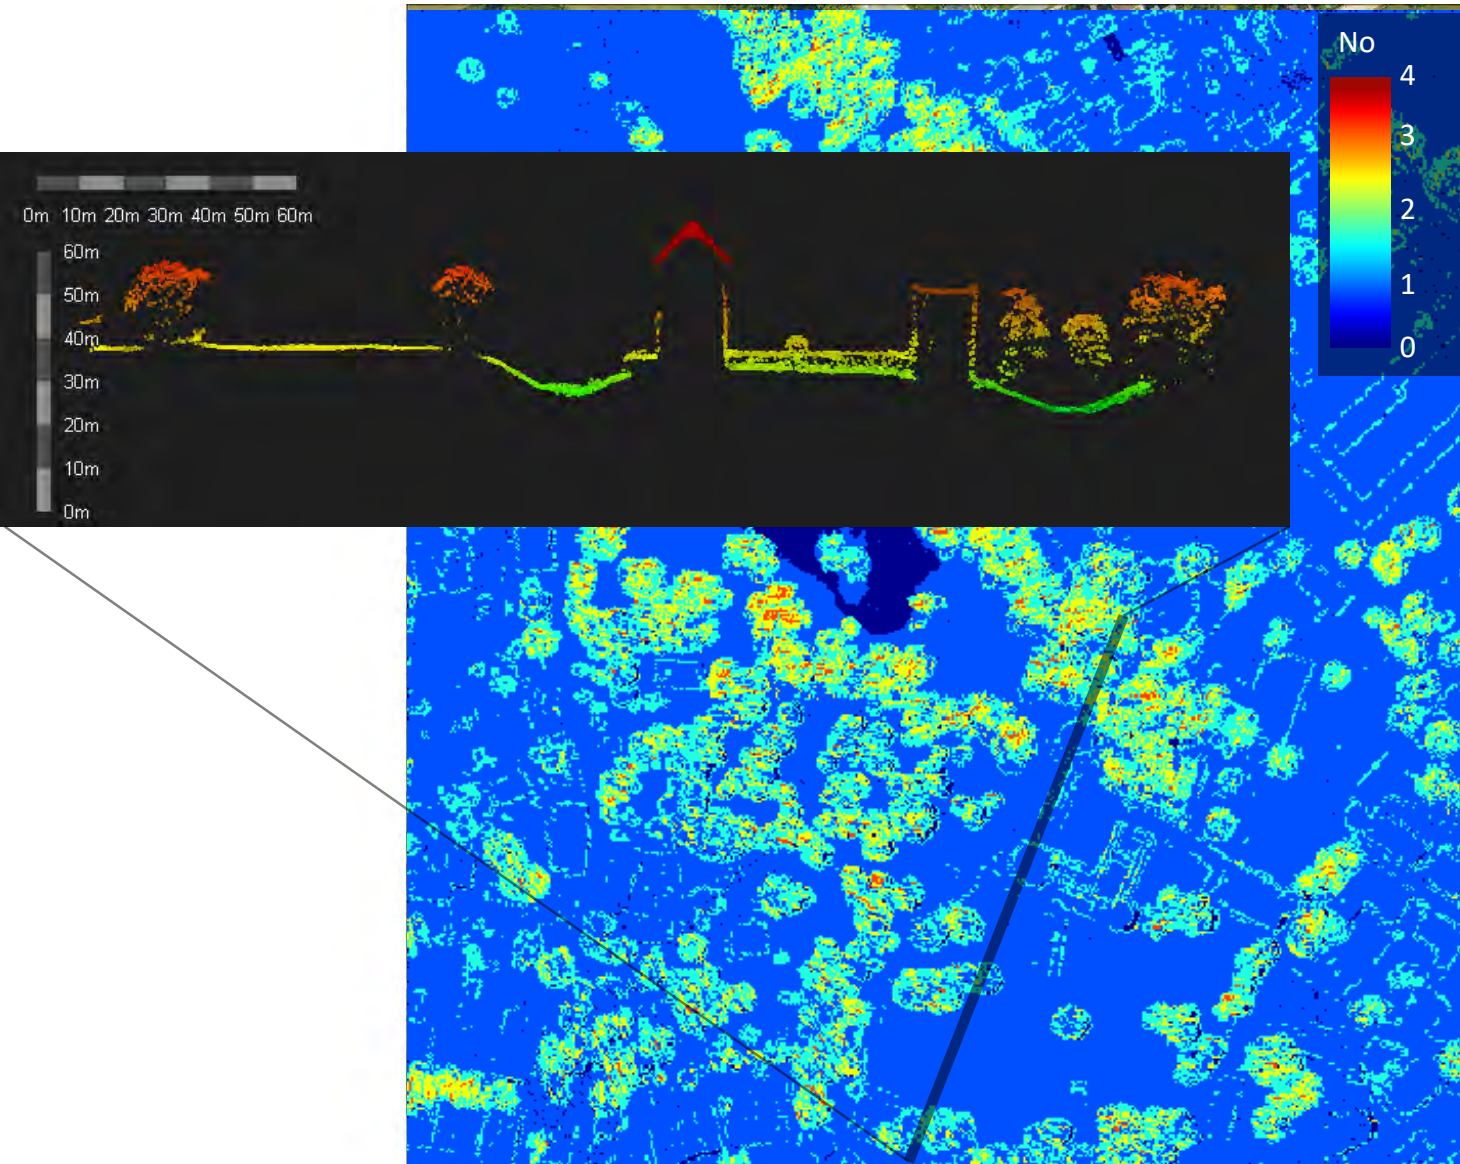

DTM is produced using 19% of points representing terrain (relief).

Normalized Digital Surface Model (NDSM)

Normalized Digital Surface Model (NDSM) is obtained subtracting DTM from DSM. NDSM could be called Canopy Height Model (CHM) if buildings are filtered out.

Multiple returns

Appearance of multiple returns – 2nd return 21,5%, 3rd return 3,6% and 4th return 0,3%.

**Remote sensing is the science (and to some extent, art)
of acquiring information about the Earth's surface
without actually being in contact with it.**
