OUTLINE

I. Radar imaging - Spatial resolution

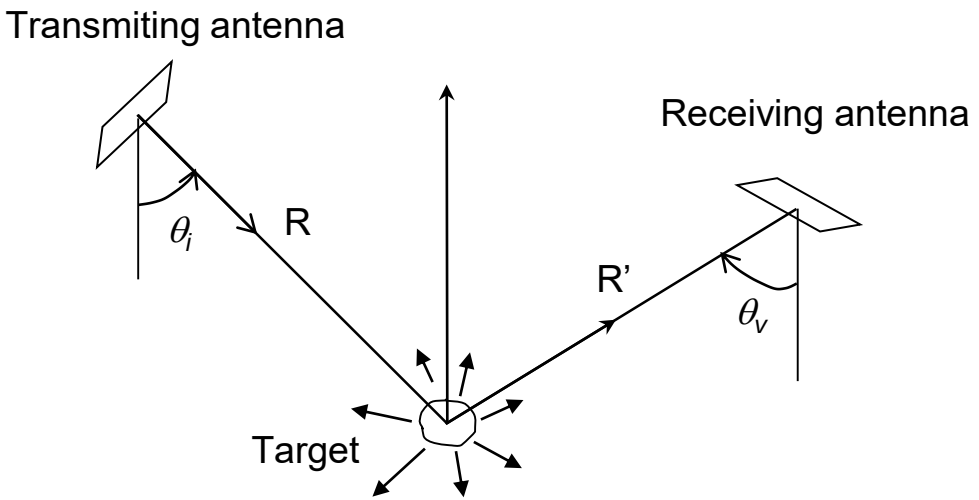
II. Polarization - Polarimetry

III. Radar response sensitivity

IV. Relief effects

V. Speckle and Filtering

The radar equation



Transmited power:

$$P_i = \frac{P_e G_e}{4\pi} d\Omega \qquad (W)$$

Receiving irradiance at distance R:

$$E_i = \frac{P_e G_e}{4\pi R^2} \qquad (W / m^2)$$

Intercepted power from the target *(W)*:

$$P_s = \frac{P_e G_e}{4\pi R^2} RCS$$

Radar Cross Section (m²)

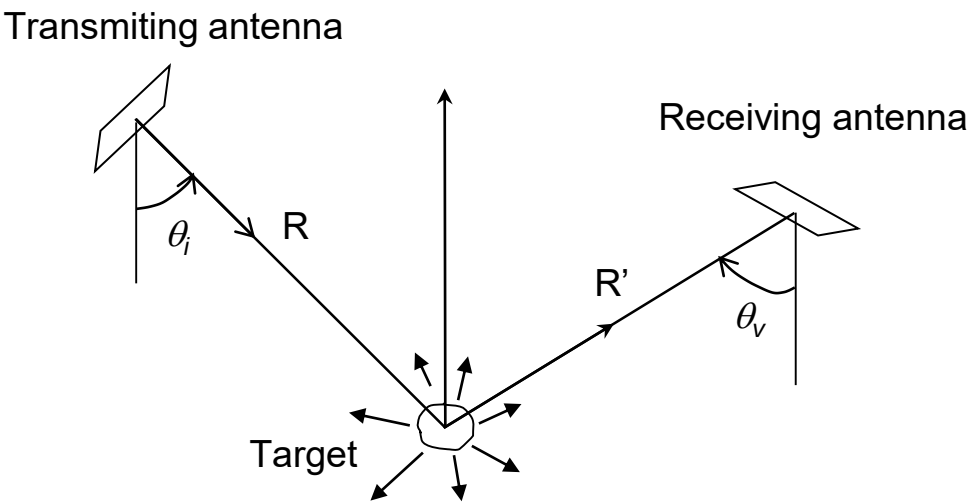
Intensity emited from the target (isotrope):

$$I = \frac{P_S}{4\pi} = \frac{P_e G_e}{4\pi R^2} \frac{RCS}{4\pi} \qquad (W/sr)$$

Power received by surface dS at distance R':

$$P_r = I\, d\Omega = I \frac{dS}{R'^2} = \frac{P_e G_e}{4\pi R^2} \frac{RCS}{4\pi R'^2} dS \qquad (W)$$

The radar equation



Power received by dS at distance R'

$$P_r = \frac{P_e G_e}{4\pi R^2} \frac{RCS}{4\pi R'^2} dS \qquad (W)$$

Recived irradiance at distance R'

$$E_r = \frac{P_e G_e}{4\pi R^2} \frac{RCS}{4\pi R'^2} \qquad (W/m^2)$$

Power received by the antenna: $P_r = E_r \, dA = E_r \frac{G_r \lambda^2}{4\pi} = \frac{P_e G_e}{4\pi R^2} \frac{RCS}{4\pi R'^2} \frac{G_r \lambda^2}{4\pi}$

(W)

The radar equation

Radar Cross Section (m^2)

Power received by the antenna:

$$dP_r = \frac{P_e G_e}{4\pi R^2} \frac{RCS}{4\pi} \frac{G_r \lambda^2}{4\pi R^2} \quad (W)$$

Case of expanse surfaces:

Radar Backscattering Coefficient:

$$\sigma^0 = \frac{RCS}{d\Sigma} \quad (m^2/m^2)$$

➔ *Analogous to the reflectance in Optical domain*

$$dP_r = \frac{P_e G_e}{4\pi R^2} \frac{\sigma^0 d\Sigma}{4\pi} \frac{G_r \lambda^2}{4\pi R^2}$$

$$\sigma^0 = \frac{(4\pi)^3}{\lambda^2} \frac{\langle P_r \rangle}{P_e} \frac{R^4}{\iint_{Surf.obs.} G_e G_r \, d\Sigma}$$

σ^0 high dynamic

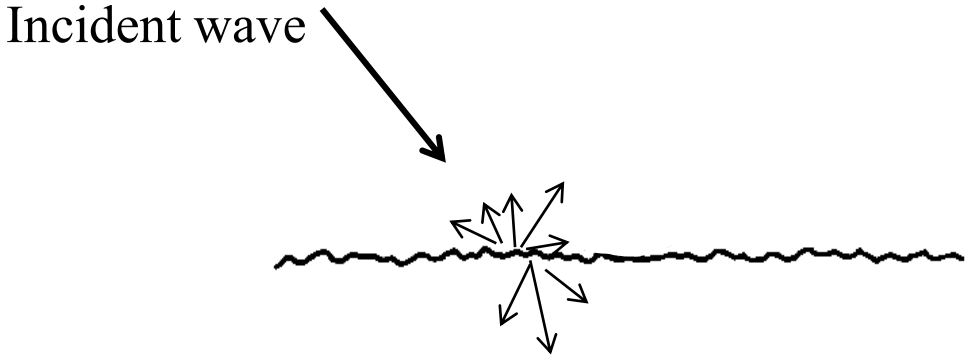
==> dB units (log. scale)

$$\sigma^0_{dB} = 10 \cdot \log_{10} \left(\sigma^0_{Nat} \right)$$

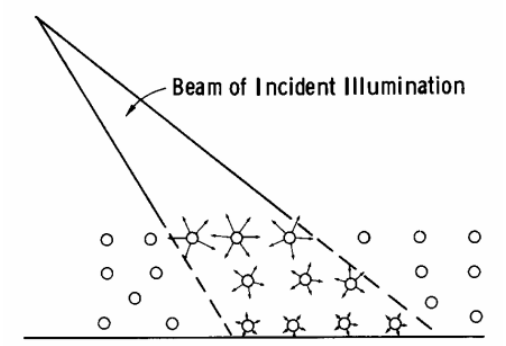
Radar images interpretation rules

2 cases of figure:

Surface scattering (interaction occurs at the interface between beth media)



Volume scattering (interaction with multiple elements = scatterers)



Radar response sensitivity

bare soils or water surfaces

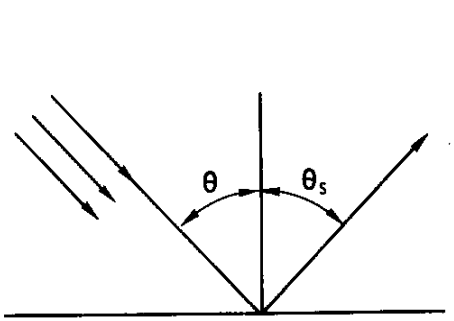
Surface Scattering

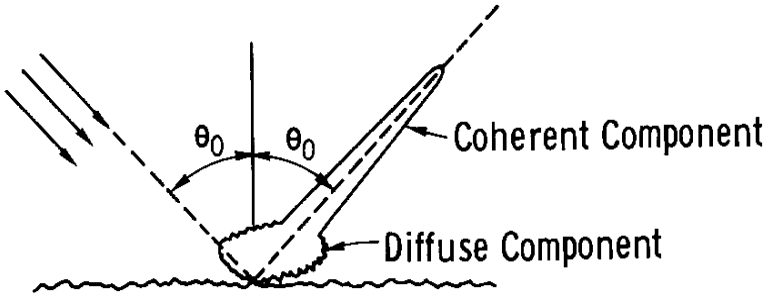
Radar images interpretation rules

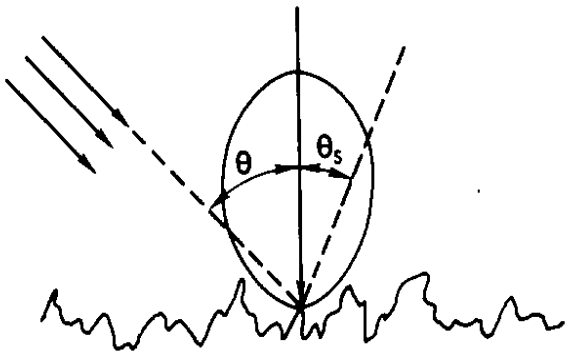
Surface scattering

Soil: homogeneous medium ==> scattering at the interface

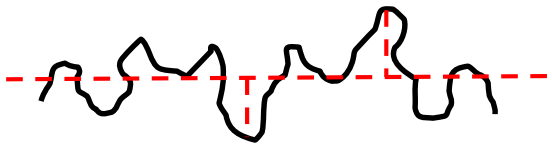
Influence of roughness







Surface roughness is refered to the radar wavelength



σ: rms height

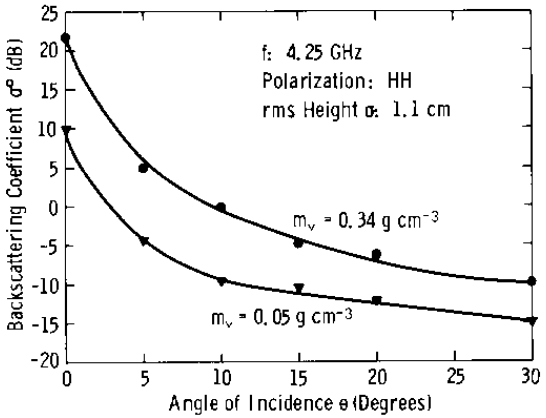
$$\sigma < \frac{\lambda}{8 \cos \theta}$$ ==> smooth surface

ERS (λ = 5 cm, θ = 23°): s > 2.10^{-2}: every soil is rough!

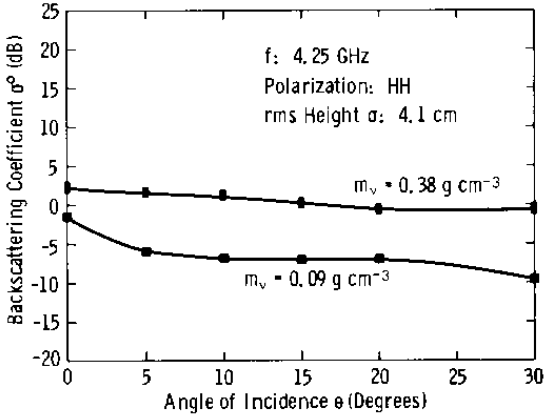
Radar images interpretation rules

Surface scattering

Smooth surface



Rough surface



(b)

Soil *roughness*: ***angular*** effect

Soil *moisture*: ***shift level*** effect

Radar response sensitivity

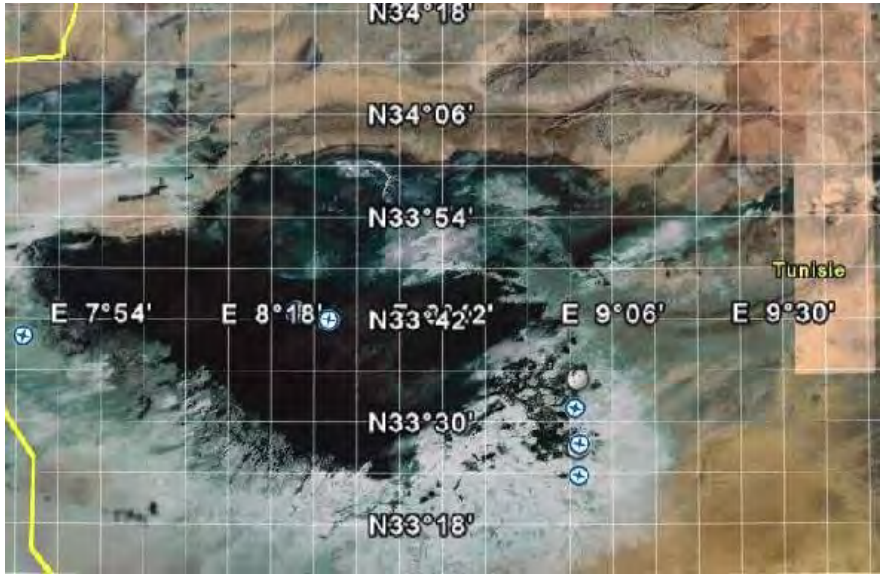
Effect of penetration

SIR A
band L

The Chott El Jerid, Tunisia

A vast evaporitic (80 x 120 km) area

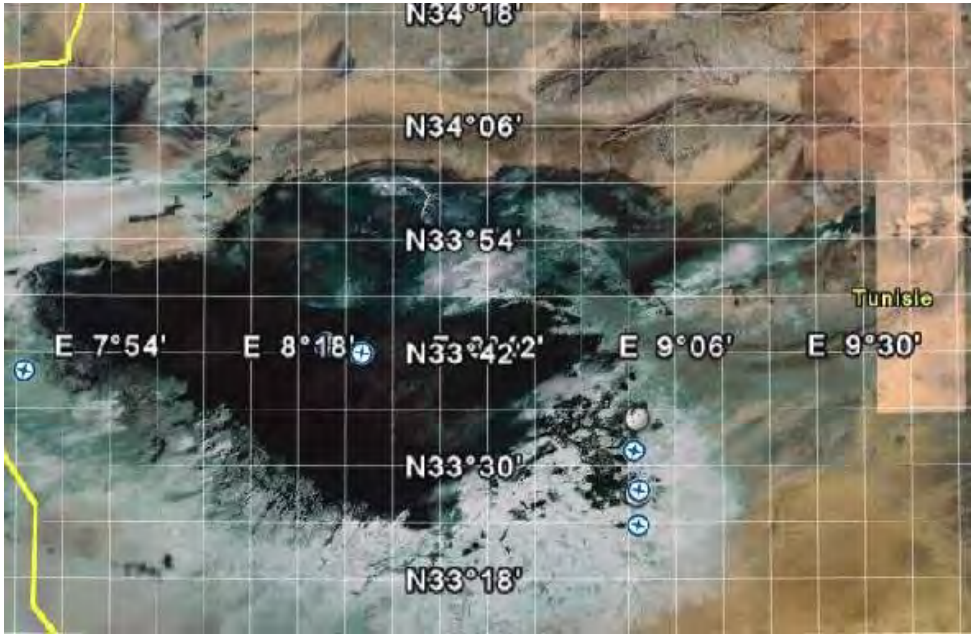


Discharge playa from a major aquifere
(upward percolation)

+

occasional runoff from neighbouring playa (Fedjadj).

➔ ***Temporary flooding***



Playas: Evaporites (saline deposits)

Flooded / dry surface

Wettest months

sudden smoothing due to dissolution of saline crust

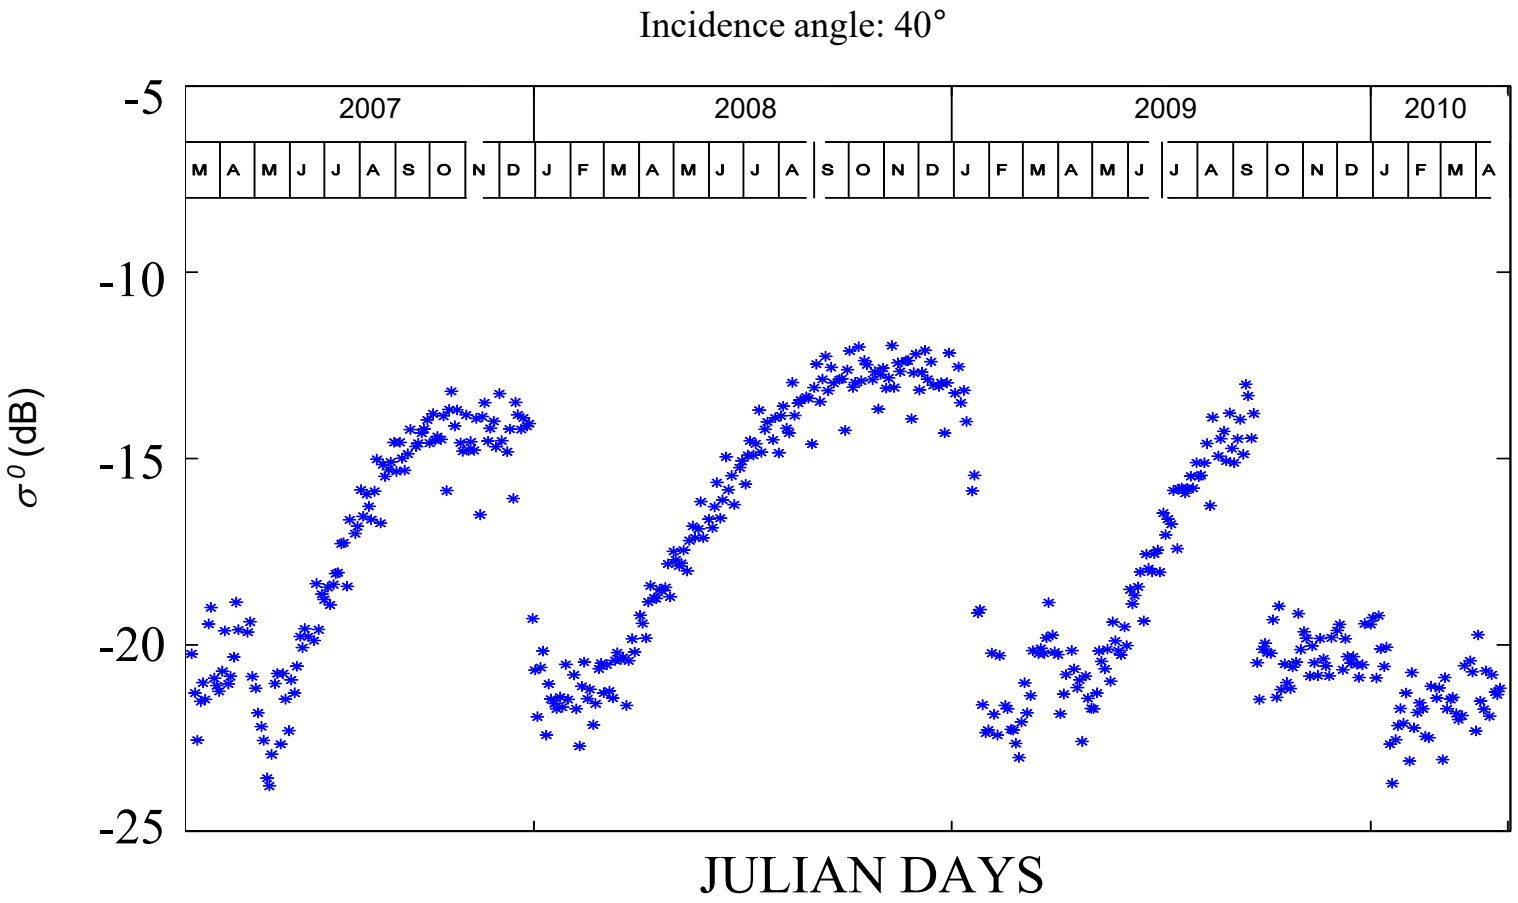
+ dramatic change of diel. const. (saline solution)

Summer months:

evaporation ➔ halite crystal growth ➔ increase of roughness

Lab and ground measurements, Death Valley
(roughness, dielectric constant)

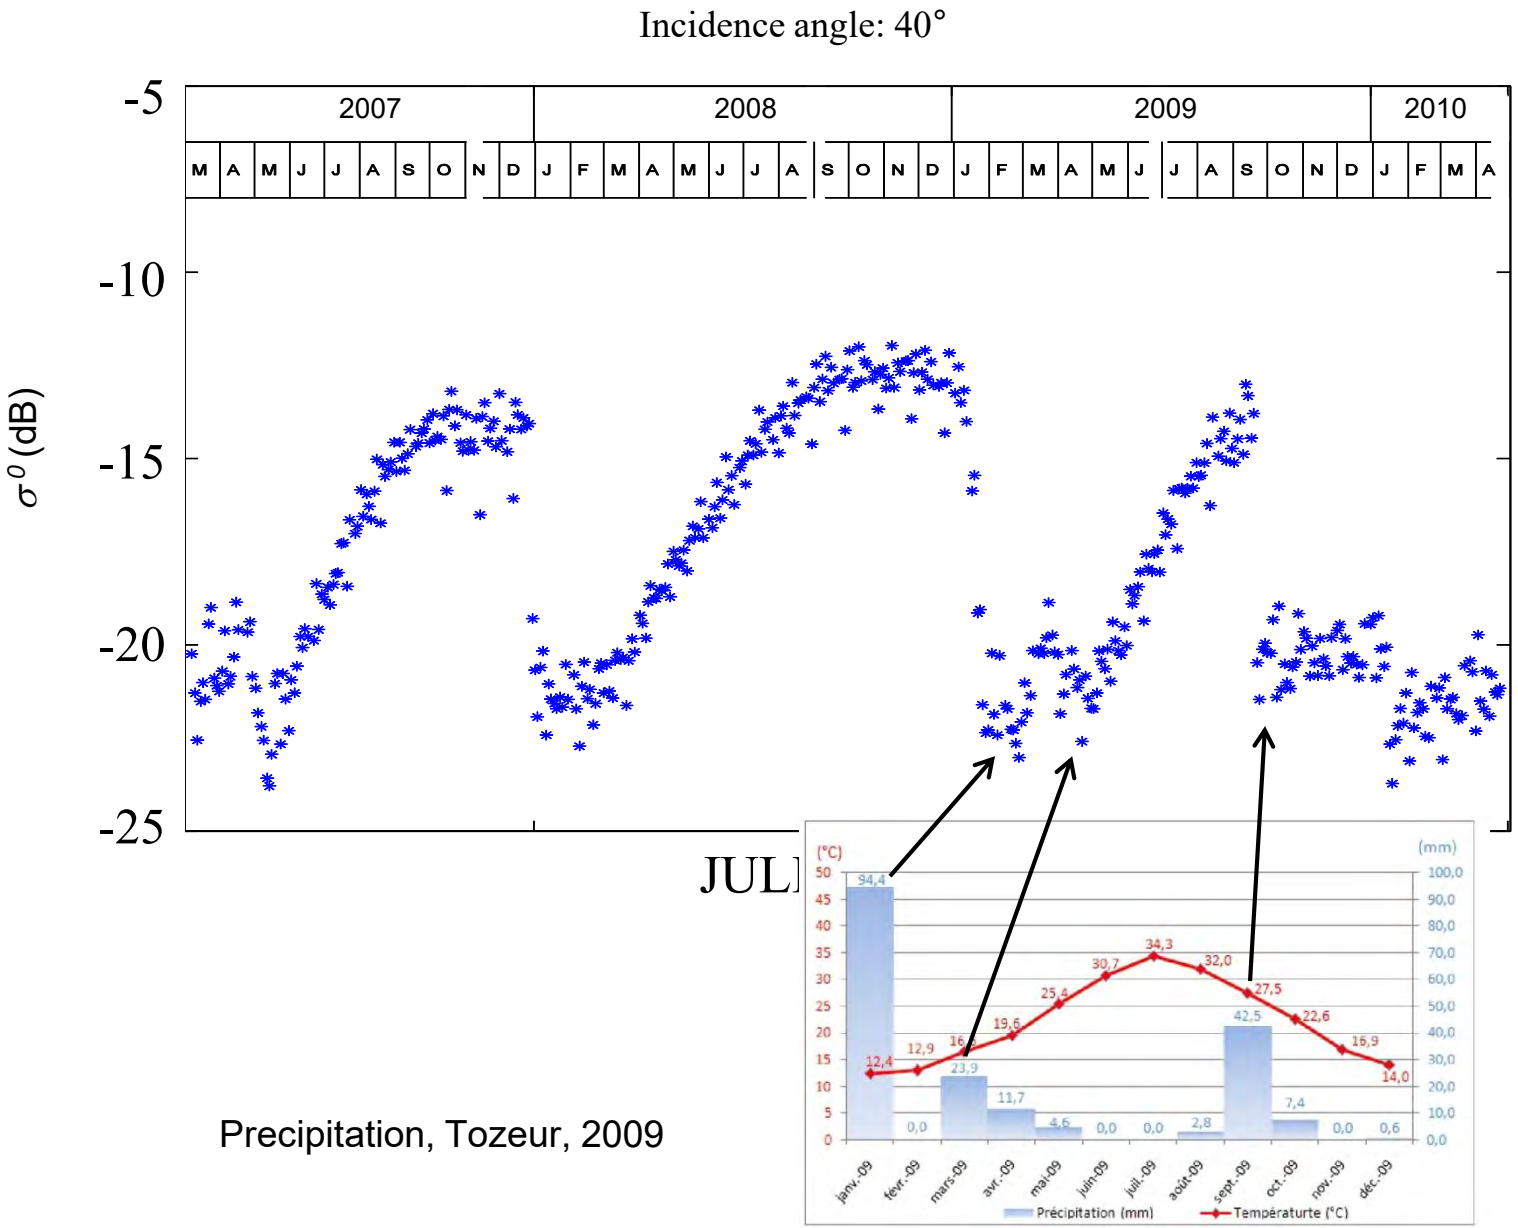
ASCAT temporal signature over the **Chott el Jerid**



High temporal dynamic (> 10 dB)

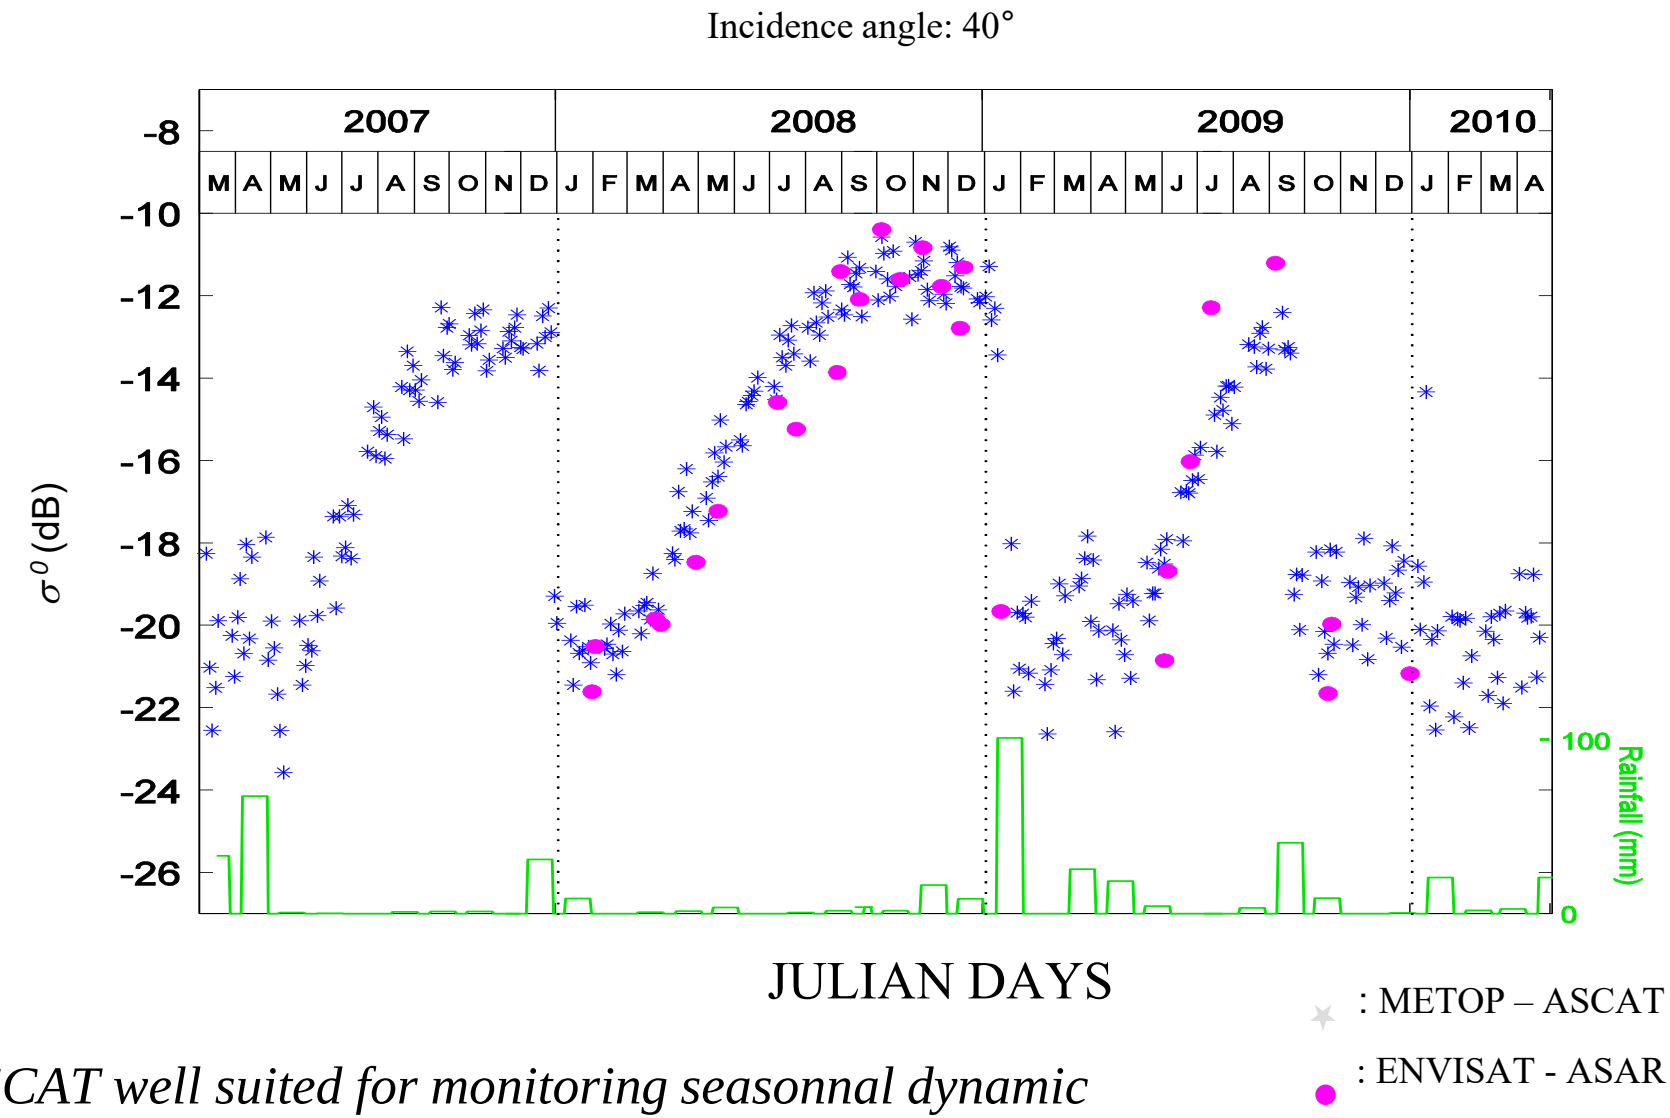
Linked to environment seasonal variations

ASCAT temporal signature over the **Chott el Jerid**



Precipitation, Tozeur, 2009

ASCAT/ASAR temporal signature over the **Chott el Jerid**



ASCAT well suited for monitoring seasonnal dynamic
