

# DTE HYDROLOGY EVOLUTION

4D reconstruction of the water cycle at the decision making scale (1 km, 1 hour)

To develop and demonstrate a **prototype of Digital Twin Earth with focus on water cycle** and hydrological processes by highlighting the huge potential of high-resolution Earth Observation products for predicting **hydrological extremes** (floods, landslides and drought) and for **water resources management**

Demo @ESA Science Hub to ACEO

- # High resolution flooding
- # What-if scenario for flood risk and water resources management

# DTE HYDROLOGY EVOLUTION OVERVIEW

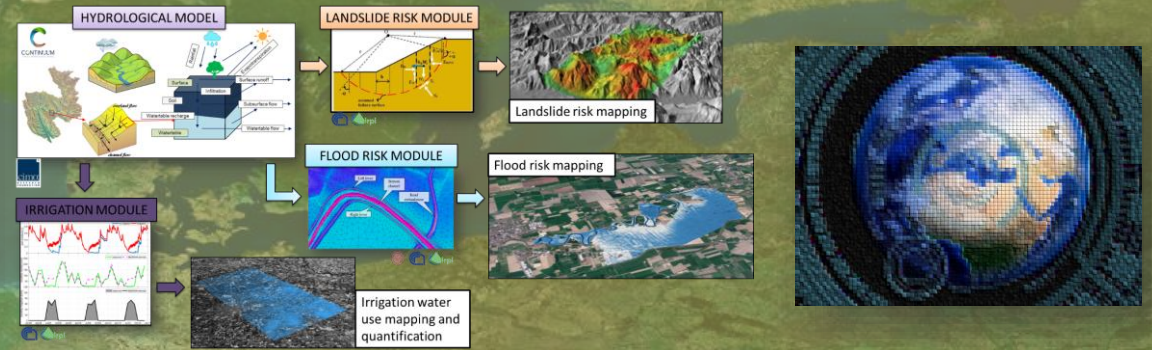

4D reconstruction of the water cycle at the decision making scale (1 km,1 hour)

## DTE Hydrology Datacube EO-based and in situ dataset

High resolution datacube (1km, 1hour\1day)

## DTE Hydrology Modelling System Physical modelling and Artificial Intelligence

## DTE Hydrology Platform

An integrated platform including observations and modelling results as a community tool to foster science and applications.

## Cloud-HPC infrastructure

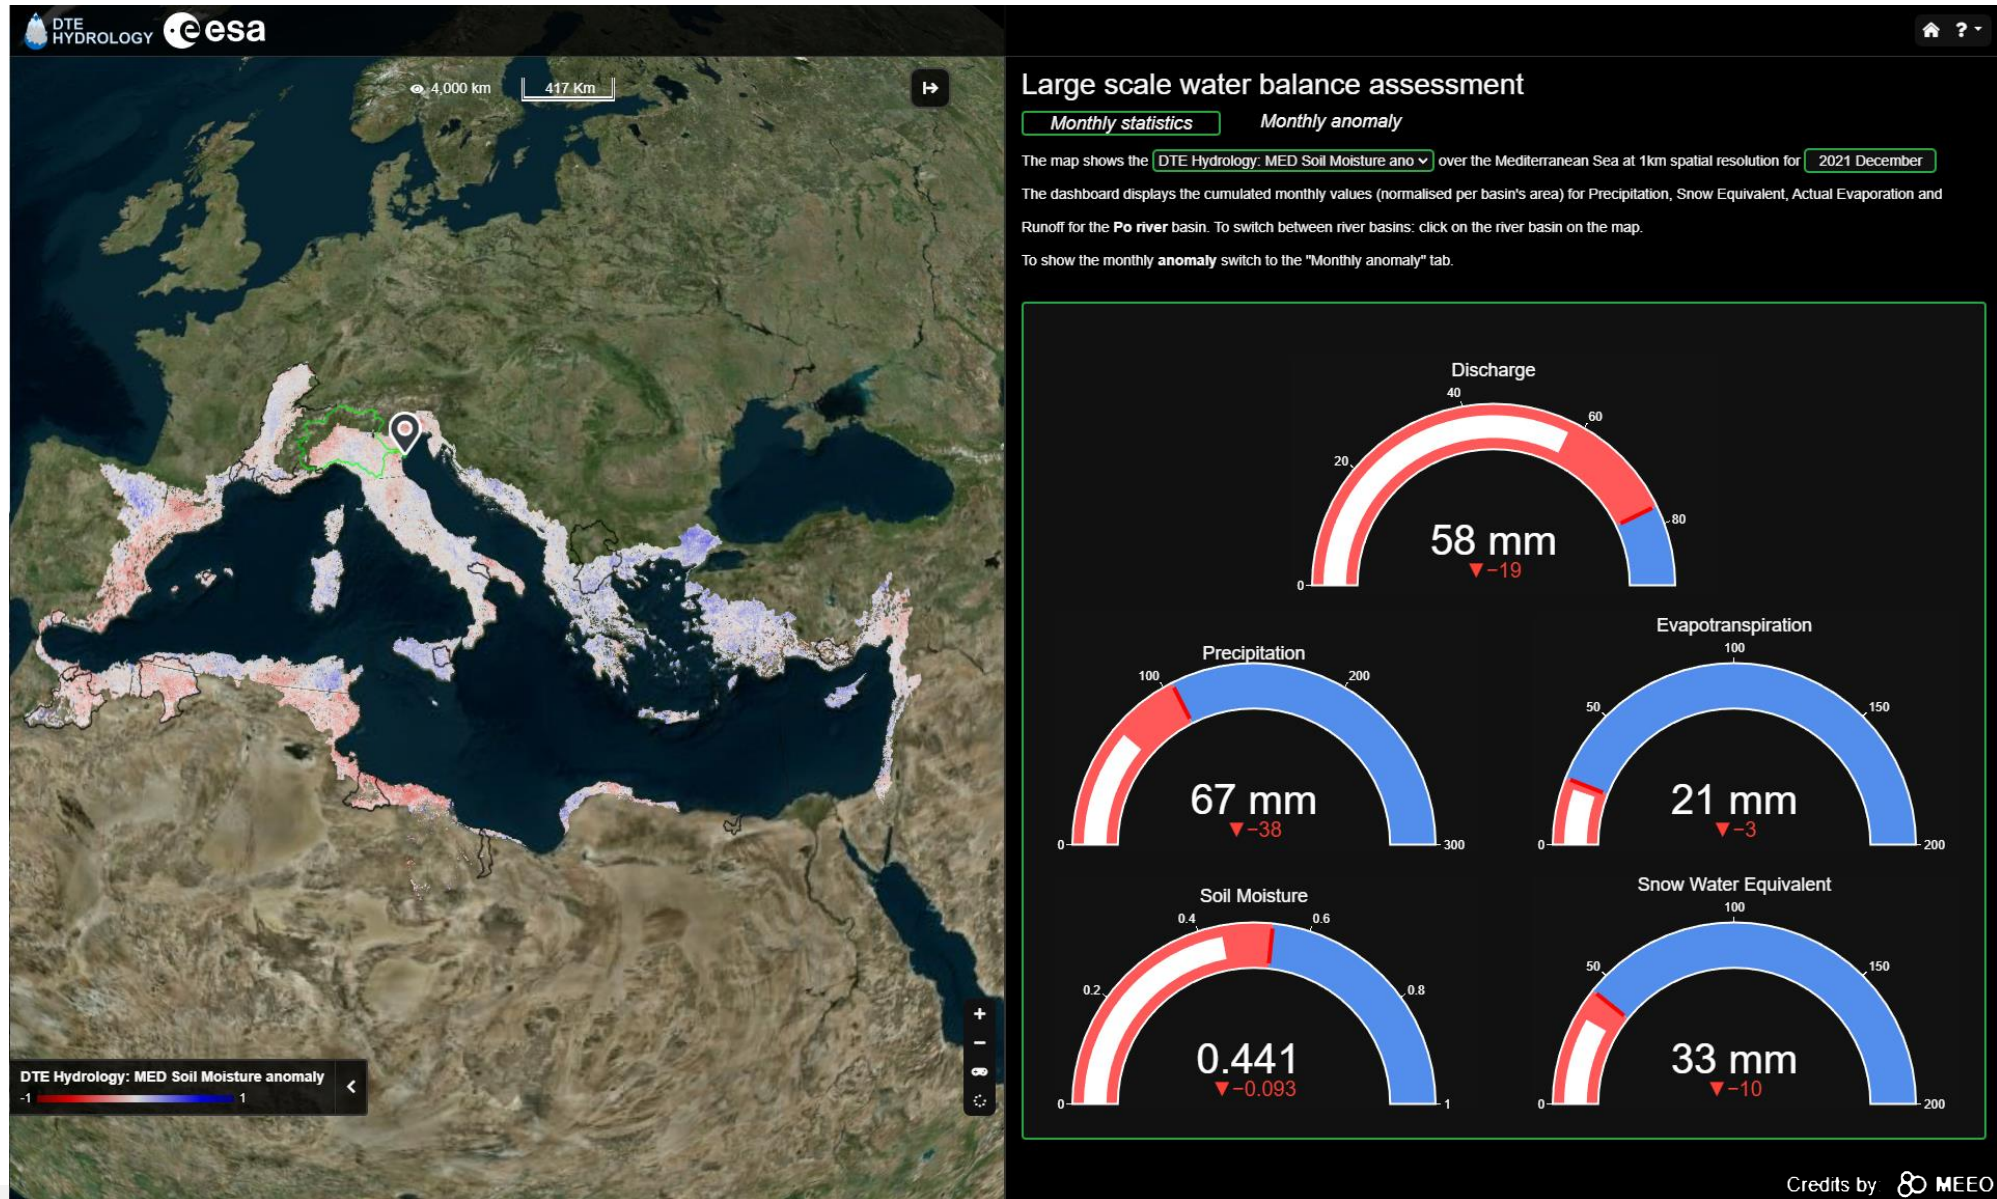

## DTE Hydrology Community

# DTE HYDROLOGY PLATFORM: DROUGHT

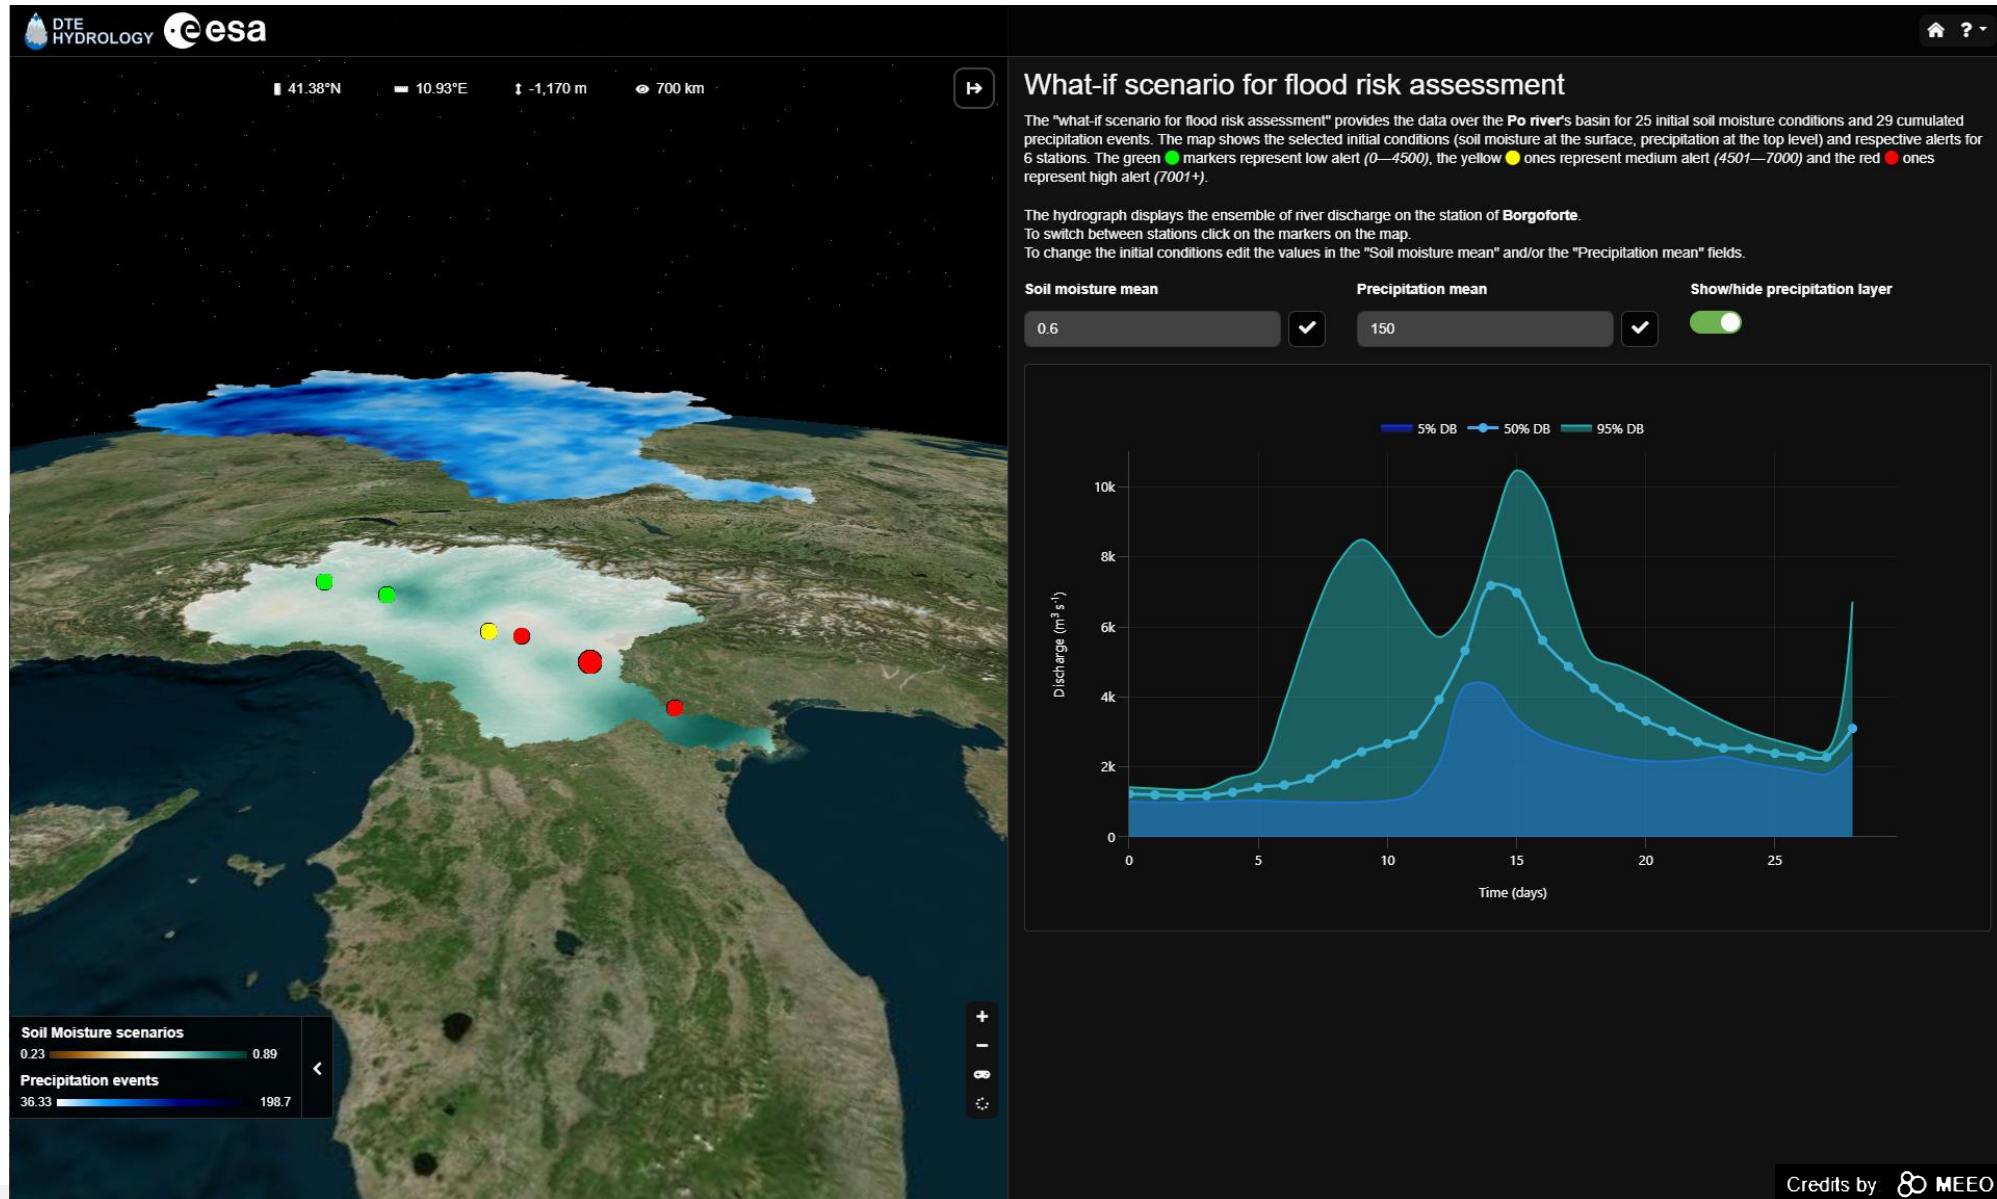

# DTE HYDROLOGY PLATFORM: FLOODING

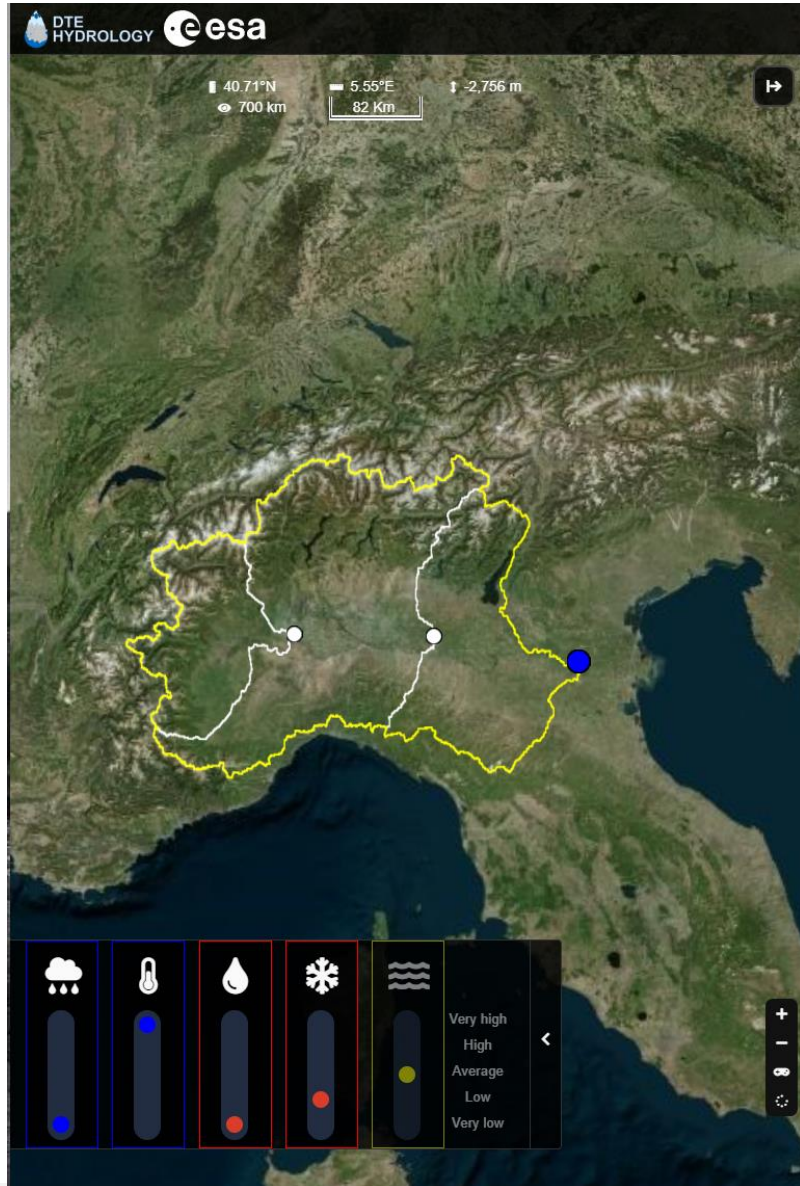

# DTE HYDROLOGY PLATFORM: WHAT-IF FLOOD RISK

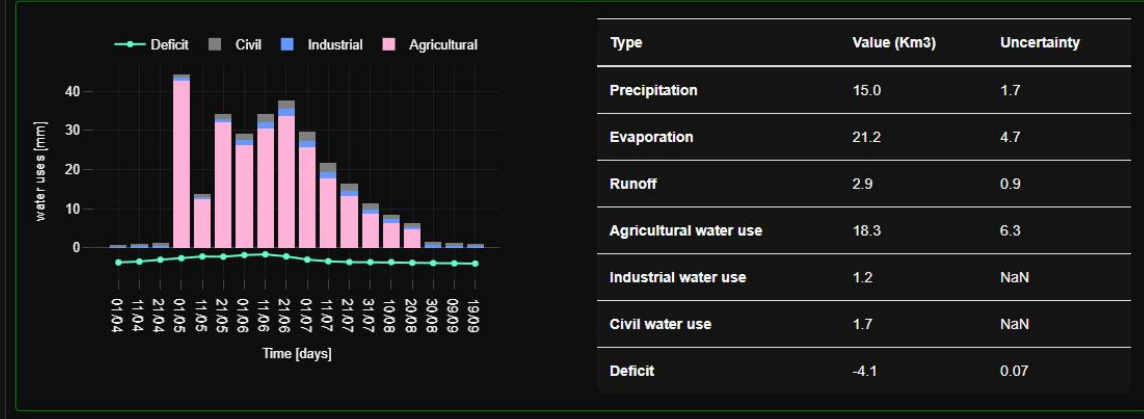

# DTE HYDROLOGY PLATFORM: WHAT-IF WATER RESOURCES

## What-if scenario for water resources management

The "what-if scenario for water resources management" provides the agricultural, civil and industrial water uses over the Po river basin from April to August as a function of different scenario (Very high, High, ..., Very low) for: (a) precipitation, (b) air temperature, (c) initial soil moisture, (d) initial snow water equivalent, and (e) releases from reservoirs (currently only average).

To show the impact of the water resources management, you can enable/disable the agricultural , civil  and industrial  water uses by clicking on the respective icon.

# DTE HYDROLOGY PLATFORM: NoR CONTRIBUTION

- Cloud resources for frontend services
  - Use cases (drought, flooding, what-if flood risk and what-if water resources)
  - Generic data exploration service
- Cloud resources for backend services
  - OGC services (OpenSearch, Web Map Service, Web Coverage Service)
  - Ad-hoc tools for climatology and anomaly computation
- Cloud storage for DTE Hydrology Datacube
- Operation and maintenance
  - Security update
  - Bug fixing

# DTE HYDROLOGY PLATFORM: SCIENTIFIC QUESTIONS

- In which area **drought** is more severe?
- How severe is current **drought** condition with respect to the past?
- How much water is needed to recover from **drought** conditions in different compartments (river, soil, snowpack, reservoirs, ...)
- Do evaporation increase or decrease during **drought**?
  
- How much rainfall is needed before river **flooding**?
- What is the impact on **flood** peak of 20% increase in initial **soil moisture**?
- Where **flooding** will occur?
- What do we need to know to predict **flood**?
  
- What is the impact on **water uses** of reducing 20% reservoir outflow? Or reducing irrigation 20%?
- What will be the impact on **water uses** of missing precipitation in the next months?

# DTE HYDROLOGY PLATFORM: OUTREACH

VIDEO PRESENTING THE DTE  
HYDROLOGY (EVOLUTION) PROJECT

DEMO VIDEO FOR THE USE OF DTE  
HYDROLOGY PLATFORM

# DTE HYDROLOGY PLATFORM: CURRENT USAGE

- Showcasing the results of DTE Hydrology Evolution project to:
  - General Public
  - Policy makers
  - Stakeholders involved in hydrological applications (flood risk, drought, water resources management)
  - Scientists
- Training Course
  - ESA courses
  - Civil Protection Centres
  - EUMETSAT courses
  - University: students and PhDs
