What Rheticus Does

From now on satellite-based information are at your fingertip. Simply login to the Web platform and get insightful geo-analytics, maps and alerts over your area of interest. Actionable information from continuous monitoring of Earth's surface, infrastructures, work sites, urban dynamics or marine coastal areas is ready to assist you in decision-making and operational activities.

Info as a Service

Rheticus®

is an automatic cloud-based geo-information service platform
for

Land, Water and Infrastructure monitoring

UTILITIES

Oil&Gas, Energy,
Mining, Sewerage,
District heating,
Desalination plants

ENGINEERING

Airport, Railways,
Roads, Tunnels, Dams,
Bridges, Subways,
Offshore drilling,
dredging

FOOD

Fishing,
Aquaculture,
Crop yield forecasting,
Precision farming

GOVERNMENT

Masterplan,
Illegal crops,
Wildfires
Coastal marine
environment

Marine

Rheticus® Marine

Rheticus® Marine is a geo-information service for the continuous monitoring of coastal seawater quality and marine resources. From now on satellite-based information are at your fingertip.

The main goal of the Marine Strategy Framework Directive is to achieve Good Environmental Status of EU marine waters by 2020.

“The environmental status of marine waters where these provide ecologically diverse and dynamic oceans and seas which are clean, healthy and productive”

- **Growth**

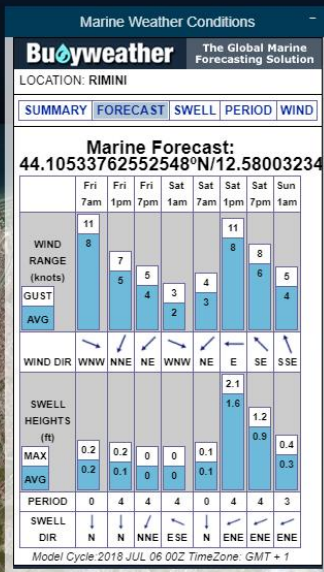

Aquaculture

A wide-angle photograph of a coastal aquaculture farm at sunset. The water is calm, reflecting the orange and yellow hues of the sky. In the foreground, there are several large, rectangular floating cages or pens. In the background, there are dark, silhouetted mountains and islands under a cloudy sky.

Rheticus® Aquaculture

Rheticus® Aquaculture provides aquaculture farmers with daily information designed for the optimal management of fish and shellfish farming activities in marine waters. aimed at

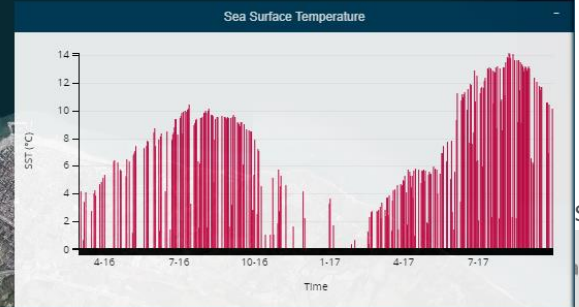

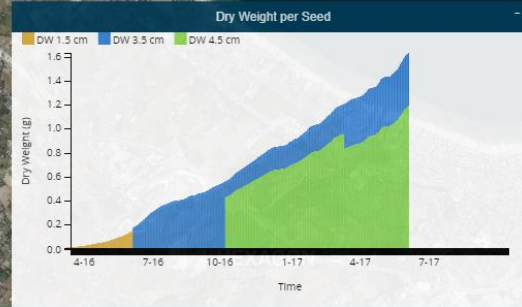

Daily Overview as of 01/07/2017

Parameter	Acronym	Value	Unit	State
Chlorophyll-a	CHL	0.67	mg/m3	■
Water Transparency	WT	10.00	m	■
Sea Surface Temperature	SST	20.14	°C	■
Product Length		6.1	cm	■
Product Dry Weight		0.6	g	■

EUGENIUS consists of Earth Observation SMEs group that provides **viable market based Earth Observation services** in different European regions

Responsible of the Marine Service Portfolio

Rheticus[®] Marine within the EUGENIUS Project

EUROPEAN GROUP OF ENTREPRISES FOR A NETWORK OF INFORMATION USING SPACE

Landslide Monitoring

EUGENIUS supports the landslide monitoring: The Sardinia case.

Water Quality Monitoring

EUGENIUS supports the monitoring of the water quality parameters.

OEnoview Quality Monitoring

Provides the state of the agriculture environment.

Flood Mapping

A dedicated service for local flood monitoring.

Precision Farming in Greece

Monitoring crops status and vigour.

Forest Dynamic Monitoring

A short description goes here.

Urban Growth Monitoring

Quantified expertise for the assessment of territorial development policies

Urban Dynamic Analytics

EUGENIUS supports urban dynamics monitoring: Bari pilot case

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 730150

The Water Quality Monitoring provides information about the ecological state of the marine environment through a series of physical parameters.

[Scroll](#) ▼

Welcome to the Water Quality Monitoring System

The use of satellite big data and other free and open data sources help detecting and continuously monitoring phenomena over coastal seawaters. The huge availability of data guarantees timely and regular intensive surveys enabling the continuous monitoring of a chosen area of interest. The service provides access to updated valuable information for classifying the status of water areas and infrastructures. The service also fits the needs of national and local authorities as well as fishing companies in terms of marine quality monitoring and preservation.

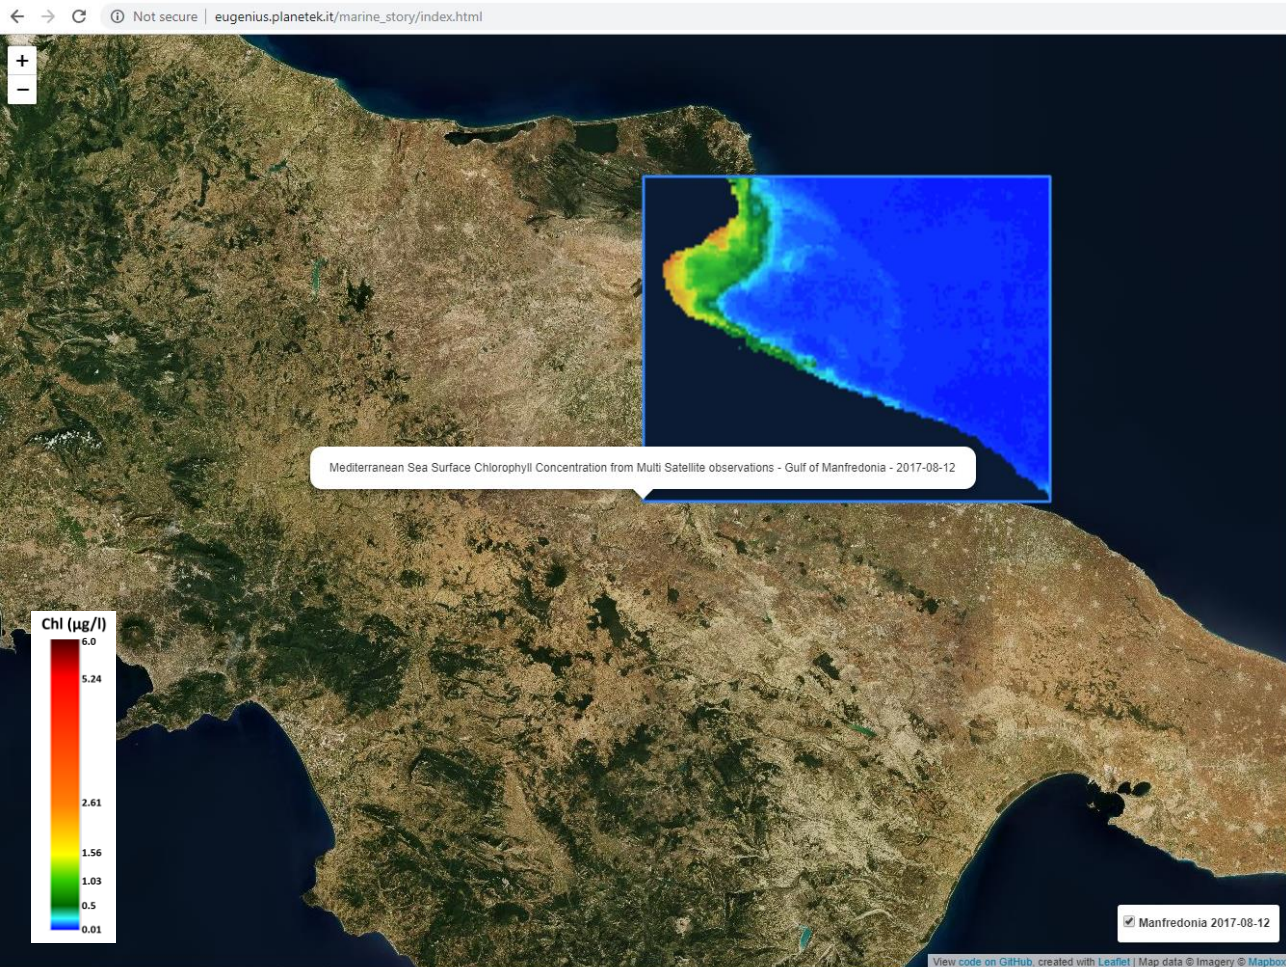

Physical parameters can be monitored such as:

- Chlorophyll-*a*(Chl) concentration.
- Total Suspended Matter (TSM).
- Water Transparency/Turbidity (WT).
- Sea Surface Temperature (SST).

[Why to monitor the WQ?](#)

European Space Agency

The Water Quality Monitoring provides information about the ecological state of the marine environment through a series of physical parameters.

EU Water Framework Directive, integrated monitoring and Assessment Programme, and so forth.

The case of Apulian waters - Gulf of Manfredonia - 2017 August 12

This is the initial situation, chlorophyll concentration is typically low in the Gulf of Manfredonia (below 3µg/l), but sometimes such value increase due to waters rich in nutrients from the inland (moderate raining occurred in this day) or for favorable conditions like in summer with high temperatures and low currents. Here the area with higher chlorophyll value is in the western part of the gulf, mainly near the shore.

In this day of hot favorable conditions like in summer with high temperatures and low currents. Here the area with higher chlorophyll value is in the western part of the gulf, mainly near the shore.

Gulf of Manfredonia - 2017 August 13

Local conditions and winds from north west bring higher Chlorophyll (between 0.5 and 1.3 $\mu\text{g/l}$) eastwards. At 1km spatial resolution a large plume far from the coast can be well distinguished. Furthermore slightly higher Chlorophyll can be seen moving all along the coast towards east.

Gulf of Manfredonia - 2017 August 14

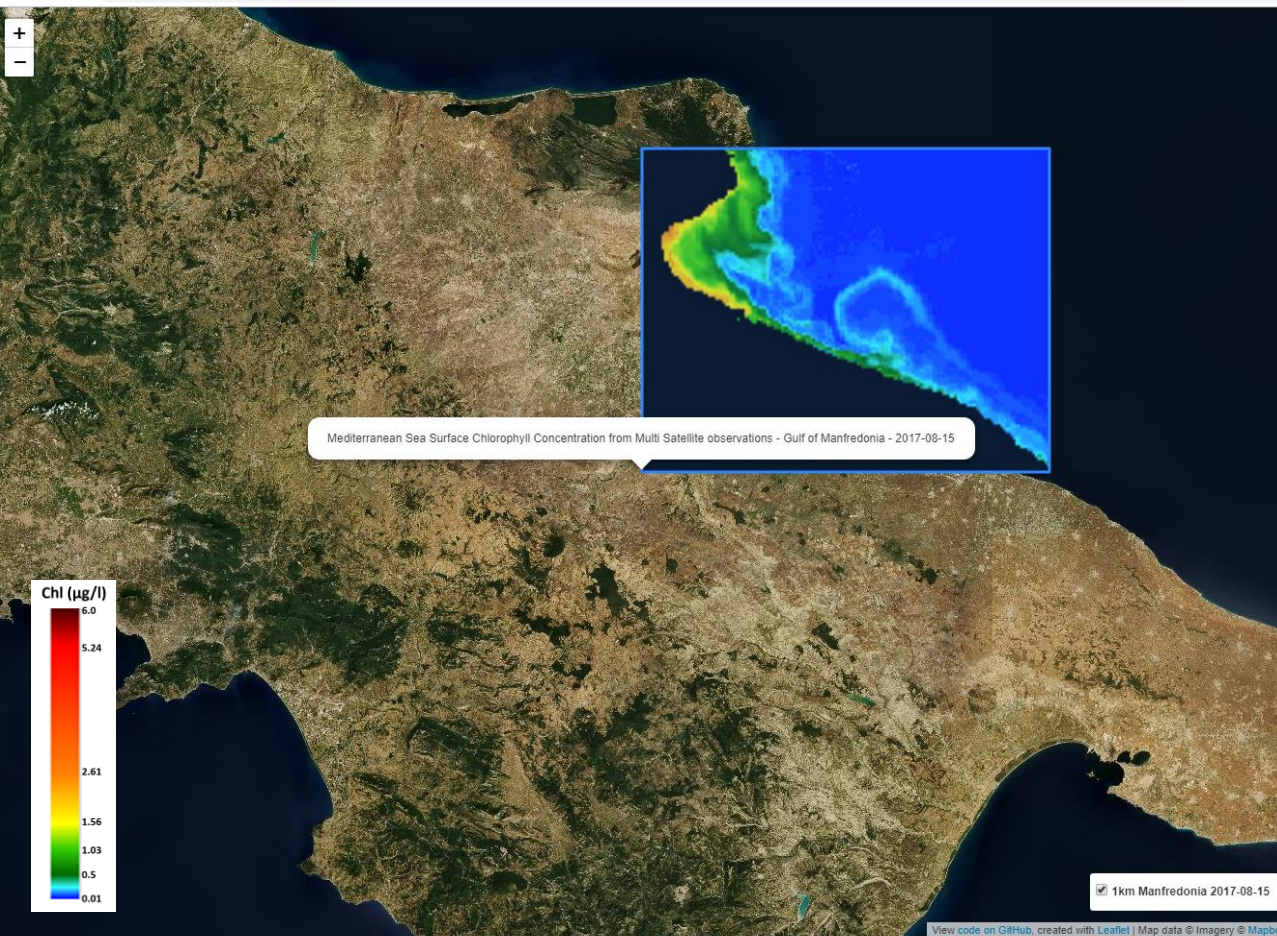

Scroll ▾

Gulf of Manfredonia - 2017 August 14

The expansion of the higher Chlorophyll area towards east continues in the main offshore plume and along the coast. Also on the western side the higher concentration Chlorophyll shows some evolutions. In the Sentinel-3 Chlorophyll map at 300m more details can be seen about the plume, the evolution on the western side and more important a better evaluation of the increase along the coast is possible. It can be noticed how at 300m resolution the harbor of Bari (in the southern part of the image) is visible.

It can be noticed how at 300m resolution the harbor of Bari (in the southern part of the image) is visible.

Gulf of Manfredonia - 2017 August 15

Chlorophyll values are generally decreasing (values are below 0.6 µg/l), but the drift towards east in the plume and along the coast continues.

Gulf of Manfredonia - 2017 August 16

Looking at the **1km map**, while the plume almost disappeared, an increase of Chlorophyll can be noticed along the coast from the middle of the image towards east, where a small plume is forming around the Bari harbor.

The **Sentinel-2 Chlorophyll map at 10m** gives much more details on this area and also in the western part of the gulf even if a large area is masked due to sun glint which can be really impacting at such spatial scale. The harbor of Bari is well visible: here such high values of Chlorophyll are due to the sum of the effects of high Chlorophyll concentration (as confirmed by the map at 1km) and of sun glint.

Gulf of Manfredonia - 2017 August 17

Mediterranean Sea Surface Chlorophyll Concentration from Multi Satellite observations - Gulf of Manfredonia - 2017-08-17

MARKET SECTOR

Planetek develops services for Coastal and Marine Environment through a proprietary platform called Rheticus®

INTERMEDIATE USER

Planetek is an intermediate user that uses Sentinel data together with Marine Copernicus Service to develop business for the final customers. Main application fields are WFD Reporting, Aquaculture and Desalination Plants

END USERS

We target end users such as national and regional environmental authorities, engineering companies, aquaculture cooperatives

- Support the transition from project/product approach to Info as a Service
- Define vertical services for selected user/market
- Connect with other ESA and European initiatives
- Strengthen the link with relevant Copernicus services (Mercator, EEA, Security)
- Address the issue of involvement of Atlantic users
- Establish permanent relations with relevant actors
- Provide requirements for future missions with a focus on Copernicus Evolution
